0.3.19	the name of the departments	5
0.3.20	the cities where the missions took place	5
0.4	Updates	6

0.1 Design

Within MongoDB, the different components of the E/R diagram will be changed like so:

- The collections are Employee & Mission. Dept will be integrated to employee
- The documents are the rows of each table.
- The columns become the fields, and since the IDs are already defined within the company.sql database, and have a signification, I will use them instead of using MongoDB's autogeneration function.
- These imported ID will still be the primary keys.

Here is also an example of the insertion of a document in each collection I defined.

```
1      db.EMP.insertOne({
2          EID: 1,
3          ENAME: "John Smith",
4          JOB: "Manager",
5          MGR: 1,
6          HIRED: "2006/08/12",
7          SAL: 7000,
8          COMM: 500,
9          DNAME: "Accounting",
10         DLOC: "New York"
11     })

1      db.MISSION.insertOne({
2          MID: 2029,
3          EID: 7654,
4          CNAME: "BMW",
5          MLOC: "BERLIN",
6          ENDD: "2011/02/09"
7     })
```

0.2 Population

```
> db.EMP.insertOne({_id:7839, ENAME:"KING",   JOB:"PRESIDENT",   MGR: null, HIRED:"1981-11-17", SAL
:5000.00,   COMM: null,   DNAME: null, DLOC: null});
{ "acknowledged" : true, "insertedId" : 7839 }
```

Figure 1: inserting an employee

```
1      db.products.insertMany( [
2          { item: "card", qty: 15 },
3          { item: "envelope", qty: 20},
4          { item: "stamps" , qty: 30 }
5      ] );
```

After that, I used the given file on campus to create the database according to your requirements.

0.3 Queries

0.3.1 all the employees

```
db.employees.find().pretty();
```

0.3.2 the number of employees

```
db.employees.count().pretty();
```

0.3.3 one of the employees, with pretty printing (2 methods)

```
db.employees.findOne();
```

```
db.employees.limit(1).find();
```

0.3.4 the name and salary of all the employees (without *id*)

```
db.employees.find(, _id:0).pretty();
```

0.3.5 the name and salary of the employees with a salary in the range [1,000 , 2,500[

```
db.employees.find(salary:$gte:1000,$lte:2500, _id : 0).pretty();
```

0.3.6 the name and salary of the clerks with a salary in the range [1,000 , 1,500[(2 methods)

```
db.employees.find(salary:$gte:1000,$lte:1500,job:"clerk", _id : 0).pretty();
```

0.3.7 the name, job and salary of the employees, sorted first by job (ascending) and then by salary (descending)

```
db.employees.find().sort(job:1,salary:-1).pretty()
```

0.3.8 the employee names that begins with 'S' and ends with 't'

```
db.employees.find(name:/^S.*t$/).pretty();
```

0.3.9 the employees whose name contains a double 'l'

```
db.employees.find(name:/.*ll.*$/).pretty();
```

0.3.10 the employees who don't have a manager

```
db.employees.find(manager:null).pretty();
```

0.3.11 the employees who work in Dallas (2 methods)

```
db.employees.find("department.location":"Dallas").pretty()
```

```
db.employees.find("department.location":$eq:"Dallas").pretty()
```

0.3.12 the employees who don't work in Chicago (2 methods)

```
db.employees.find("department.location":$ne:"Chicago").pretty()
```

```
db.employees.find("department.location":$not:$eq:"Chicago")
```

0.3.13 the employees who did a mission in Chicago

```
db.employees.find("missions.location":"Chicago").pretty()
```

0.3.14 the employees who did a mission in Chicago or Dallas

```
db.employees.find($or:["missions.location":"Chicago","missions.location":"Dallas"]).pretty()
```

0.3.15 the employees who did a mission in Chicago and Dallas

```
db.employees.find($and:["missions.location":"Chicago","missions.location":"Dallas"]).pretty()
```

0.3.16 the employees who did a mission for IBM in Chicago

```
db.employees.find($and:["missions.name":"IBM","missions.location":"Chicago"]).pretty()
```

0.3.17 the employees who did their first mission for IBM

```
db.employees.find("missions.company":"IBM","missions.location":"Chicago").pretty();
```

0.3.18 the employees who did exactly two missions

```
db.employees.find("missions":$size:2)
```

0.3.19 the name of the departments

```
db.employees.distinct("department.name")
```

0.3.20 the cities where the missions took place

```
db.employees.distinct("missions.location")
```

0.4 Updates

- 1. `db.employees.updateMany(job:"clerk",$inc: salary:300)`
- 2. `db.employees.updateMany(manager:null)`
- 3. `db.employees.updateMany("department.name":"Accounting",$set: "department.location":"Dallas")`
`"acknowledged" : true, "matchedCount" : 3, "modifiedCount" : 3`
- 4. `db.employees.updateMany("department.location":"New-York",$unset:missions:"");`
